**Insights and Visualizations**

I learned a lot of practically lessons from this project:

1. How to wrangle data from different sources.
2. How to consolidate datasets from different sources.
3. How to use the request package to access file from a server.
4. How to properly create tests to see if your cleaning efforts worked.

It is important to go through the steps of wrangling. I found it helpful to write my ideas of what needed to be cleaned and then organizing them once I understand and assessed all the datasets. I also found it helpful to randomly visit the links and open the dataset in excel.

I chose to do 2 visualizations.

My first visualization was on looking at the 30 top names of dogs using a histogram. The top 3 dog names were Cooper, Oliver, and Lucy. I will definitely have to keep this in mind when choosing the name of my next dog. It was also interesting to see that the name of my dog isn't on the top 30 list!

The second visualization was on the most popular dog breeds. I could guessed that golden retriever would be the most popular and it is! I also learned what a pembroke dog type was! It is acutally a corgi.
